Capstone Project Read me

- The data exploration jupyter notebook should be open and run first. It takes the given csv files and adds features and organizes the data. It will also generate csv files for each body part.
- Each Jupyter notebook after the data exploration notebook will generate a model based on the body part it is named after
- At the end of each notebook after the data exploration notebook the models that are used in the final project are scored and their precision, accuracy, and recall are calculated.
- To run the flask app you need the models and their weights saved into the model sub folder in the flask folder
- The website layout is in the static sub folder in the flask folder
